 **Project Part 2 Video.mp4**

Initial Project Idea:

MemoryQuill is a web application that allows users to quickly create, read, update, and delete personal diary entries. Each entry contains a title, date, time, body text, tags, mood emojis, and the ability to mark the entry as public or private. The landing page consists of a clear site name and a custom logo. For the first release, we will focus on core functionality and a simple, usable layout with the key CRUD features to create a working diary entry button, a landing page with the site name and logo, a dashboard table that lists all the entries, etc. Future enhancements could include user authentication, entry exports into PDF, search and filter to find diary entries more easily, and a calendar view.

Contributions:

 = Contributions For Part 2

Group Member	Role/Responsibilities
Yusuf Mohamed	- Created auth/register.ejs - Handled GitHub errors

	- Created starter code - CRUD features - Routes - Readme file - Hosted MongoDB database - Website content
Justyn Umrah	- Created auth/login.ejs - Created Google Slides - Edited video - Footer - Navbar - Website content (text and titles) - Partial - Cleaned up GitHub
Adeel Mohammad	- Created models/user.js - Initial draft for website idea - Created logo - app.css
